#### Abstract

Novel potent prostate cancer antigen-1 (PCA-1)/alpha-ketoglutarate-dependent dioxygenase alkB homolog 3 (ALKBH3) inhibitors both in vivo and in vivo were designed and evaluated by stability assay in an S9 mixture, a mixture of rat liver homogenate and co-factors, and oral absorbability assay in rat, as well as enzyme and cell assays, and resulted in the synthesis of a novel potent PCA-1/ALKBH3 inhibitor in vivo. Among them, compound 71 exhibited potent inhibitory activities in a xenograft model bearing DU145 tumor at 10 $\mathrm{mg} / \mathrm{kg}$ by subcutaneous administration without negative sideeffects. This inhibitory activity in vivo was more potent than that of HUHSO15 at $32 \mathrm{mg} / \mathrm{kg}$, a known PCA-l/ALKBH3 inhibitor, or docetaxel at $2.5 \mathrm{mg} / \mathrm{kg}$, the drug clinically used for androgen-independent prostate cancer.

Developing novel drugs against prostate cancer that are effective against both androgen-dependent and independent cancer types is now urgently required (1). Tsujikawa et al. reported a novel gene that encodes a DNA and RNAalkylating damage-repair enzyme called prostate cancer antigen (PCA)-1/alpha-ketoglutarate-dependent dioxygenase alkB homolog 3 (ALKBH3) that is highly expressed in clinical prostate cancer cells; genetic inhibition by injecting siRNA in vivo effectively inhibited the growth of androgenindependent prostate cancer cells DU145 cells that also

[^0]Key Words: Anti-prostate cancer drug, docetaxel, DU145, xenograft model, anticancer drug, metabolic reaction, hepatic microsome, S9 mixture, drug design.
express high levels of PCA-1/ALKBH3 (2-4). Suppression of PCA-1/ALKBH3 led to 3-methylcytosine accumulation and reduced cell proliferation in various cell lines (5). Therefore, a small and orally available PCA-1/ALKBH3 inhibitor could be a novel and clinically effective anti-prostate cancer drug, even for hormone-independent cancer. In previous work, we reported the first PCA-1/ALKBH3 inhibitor, HUHS015 (Figure 1), and its effectiveness in a xenograft model bearing DU145 tumors without any observable side-effects or toxicity. However, the inhibitory activity of HUHS015 was not sufficient especially after 1 week, although subcutaneous injection of $32 \mathrm{mg} / \mathrm{kg}$ HUHSO15 completely suppressed the growth of DU145 cells in xenograft model up to 1 week (Figure 2) (6). Interestingly, in continuous study using rat S9 mixture, a mixture of rat liver homogenate including many metabolic enzymes and co-factors that is often used to estimate a compound's metabolic stability, we found that no HUHS015 was not detected in a S9 mixture at $37^{\circ} \mathrm{C}$ after a 10 min treatment and only $42 \%$ of HUHS015 remained even at $15^{\circ} \mathrm{C}$ indicating that HUHS015 was easily decomposed in liver in vivo after administration. In fact, only $0.08 \mu \mathrm{~g} / \mathrm{ml}$ of HUHS015 was found in rat serum 60 min after oral administration of $32 \mathrm{mg} / \mathrm{kg}$, while no metabolite so far has been identified, and its suppressory effects in vivo were not adequate in a xenograft model after long-term administration (Figure 2). Accordingly, we next focused our efforts to obtain novel PCA-1/ALKBH3 inhibitors that were more stable and effective in in vivo assays during the administration period. We herein report the design of novel PCA-1/ALKBH3 inhibitor and in vitro as well as in vivo structure-activity relationship studies, stability assay in S9 mixture, oral absorbability assays in rat, as well as enzyme and cell assays.

## Materials and Methods

Cell culture. The human prostate cancer cell line DU145 was supplied from the Cell Resource Center for Biomedical Research

Figure 1. Structure of inhibitors studied.

Figure 2. The body weights and anti-proliferative effects of HUHSO15 in mice bearing DU145 cell xenografts. Male nude mice were implanted subcutaneously with approximately $8 \times 10^{6}$ DU145 cells mixed with Matrigel ${ }^{T M}$ into the right flank. When the estimated tumor volume had reached almost $200 \mathrm{~mm}^{3}$, after randomization, mice were treated with HUHSO15 subcutaneously administered once a day at $32 \mathrm{mg} / \mathrm{kg}$ (open symbols) or with vehicle alone (closed symbols). A: Body weights were measured at intervals. B: Tumor volume was calculated by caliper measurements of the width $(W)$ and length $(L)$ (volume $=L \times W^{2} / 2$ ), and tumor volumes were estimated relative to those at day 0 . Each value represents the mean $\pm$ SE of six mice. No statistically significant differences were observed by Student's t-test.

Institute of Development, Aging, and Cancer, Tohoku University, Japan. The cell line was maintained in Dulbecco's modified Eagle's medium (DMEM) supplemented with $10 \%$ fetal calf serum (FCS) and $100 \mu \mathrm{~g} / \mathrm{ml}$ kanamycin at $37^{\circ} \mathrm{C}$ under a humidified atmosphere containing $5 \% \mathrm{CO}_{2}$.

Animal care. Male nude BALB/c mice and male Sprague-Dawley (SD) rats were purchased from Japan SLC Inc. (Shizuoka, Japan) at 4 weeks old, almost 13 g body weight. Animals were kept under conditions of constant temperature and humidity, and fed a standard diet and water ad libitum. All animal experiments in this study were approved by our Institutional Animal Care Committee (\#2013-01, 2013-19, 2015-28, and 2015-29).

Synthesis of compounds studied in this study. The substituted pyrazoles studied in this work were synthesized by condensing substituted hydrazines (5) with $\beta$-keto esters (6) as shown in Figure 3. Hydrazine derivatives (5) were synthesized from ophenylenediamines (2) via 1,3-dihydro-benzimidazol-2-ones (3) and

2-chloro-benzimidazoles (4). ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded on a JEOL JNM-ECX400 spectrometer at 400 MHz , or Agilent NMR system PS 600 system at 600 MHz using $\mathrm{CDCl}_{3}$, dimethylsulfoxide (DMSO) $-\mathrm{d}_{6}, \mathrm{CD}_{3} \mathrm{OD}$ or acetone- $\mathrm{d}_{6}$ as solvent. Chemical shifts were given in $\delta$ values ( ppm ), using tetramethylsilane $(\delta=0.00)$ as the internal standard; coupling constants $(J)$ were given in Hz. Signal multiplicities were characterized as $s$ (singlet), d (doublet), $t$ (triplet), q (quartet), m (multiplet), br (broad signal). IR spectra were recorded on a JEOL FT-IR 4100 spectrometer. ESI-MS spectra were taken on Bruker microTOF-Q mass spectrometer. All reactions were monitored by thin-layer chromatography carried out on a 0.25 mm E. Merck silica gel plates $60 \mathrm{~F}_{254}$ using UV light, iodine, or $5 \%$ ethanolic phosphomolybdic acid solution and heat as developing agents.

Synthesis of 5-fluoro-1H-benzo[d]imidazol-2(3H)-one (3l). To a solution of 4-fluorobenzene-1, 2-diamine (2l, $\mathrm{R}^{1}=\mathrm{F}, 5.20 \mathrm{~g}, 41.2$ mmol ) in THF ( 50 ml ) were added 1,1-carbonyldiimidazole ( 7.35 g , 45.4 mmol ) in 5 parts under ice-cooling. After being stirred for 2 h

Figure 3. Scheme for synthesis of compounds studied in this work. Reagents and conditions: (a) 1,1-carbonyldiimidazole, (b) $\mathrm{POCl}_{3}$, (c) $\mathrm{NH}_{2} \mathrm{NH}_{2}$ hydrate, (d) 6, in AcOH .
at room temperature, the reaction mixture was added to 1 N HCl under ice-cooling. The reaction mixture was filtered and dried under reduced pressure to give 5 -fluoro- 1 H -benzo[d]imidazol- $2(3 \mathrm{H})$-one (31, $\mathrm{R}^{1}=\mathrm{F}, 5.20 \mathrm{~g}$ ), was used without further purification. 1H-NMR $\left(400 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 6.73\left(1 \mathrm{H}, \mathrm{ddd}, \mathrm{J}=10.4\left(J_{\mathrm{HF}}\right), 8.4\right.$ and 2.4 Hz$)$, $6.76\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=9.2\left(J_{\mathrm{HF}}\right)\right.$, and 2.4 Hz$), 6.87(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=8.4$ and 4.8 $\left.\left(J_{\mathrm{HF}}\right) \mathrm{Hz}\right), 10.6(1 \mathrm{H}, \mathrm{s}), 10.7(1 \mathrm{H}, \mathrm{s})$.

Synthesis of 5-fluoro-2-hydrazino-1H-benzo[d]imidazole (5l). A mixture of 5-fluoro-1H-benzo[d]imidazol-2(3H)-one (31, R ${ }^{1}=\mathrm{F}, 5.20$ g) and phosphoryl chloride ( $32 \mathrm{ml}, 341 \mathrm{mmol}$ ) was stirred for 24 h at $120^{\circ} \mathrm{C}$. After cooling to ambient temperature, the mixture was added to 1 N NaOH (resulting pH was almost 8 ). The aqueous layer was extracted with ethyl acetate for three times. The combined organic layers were washed with water and brine, then dried over anhydrous $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The crude product was purified by silica gel column chromatography ( $n$-hexane/ethyl acetate $=1 / 1$ ) to give compound $41\left(\mathrm{R}^{1}=\mathrm{F}, 4.22 \mathrm{~g}\right.$, $60 \%$ by 2 steps) as pale yellow precipitates. $\left(400 \mathrm{MHz}\right.$, DMSO- $\mathrm{d}_{6}$ ) $\delta 7.09\left(1 \mathrm{H}\right.$, ddd, $J=9.2\left(J_{\mathrm{HF}}\right), 8.8$ and 2.8 Hz$), 7.36(1 \mathrm{H}, \mathrm{dd}, J=9.2$ $\left(J_{\mathrm{HF}}\right)$, and 2.8 Hz$), 7.52\left(1 \mathrm{H}, \mathrm{dd}, J=8.8\right.$ and $\left.4.8\left(J_{\mathrm{HF}}\right) \mathrm{Hz}\right)$; IR $(\mathrm{KBr})$ : 3035, 2959, 2900. 2784, 2636, 1440. 1348, 1148, $1108 \mathrm{~cm}^{-1}$, ESIHRMS (positive ion, sodium formate): calcd for $\mathrm{C}_{7} \mathrm{H}_{3} \mathrm{ClFN}_{2}$ ([M-$\mathrm{H}]^{-}$) 168.9974 ; found 168.9986 ; m.p. $146-149^{\circ} \mathrm{C}$. A mixture of 41 $(1.30 \mathrm{~g}, 7.62 \mathrm{mmol})$ and hydrazine monohydrate $(7.30 \mathrm{ml}, 152$ mmol ) was stirred for 2.5 h at $120^{\circ} \mathrm{C}$. After being cooled to ambient temperature, the reaction mixture was added to water. NaCl was added to the mixture and stirred at ambient temperature, the resulting precipitates were collected by filtration. The precipitates were washed with water, and then dried in vacuo to give 5-fluoro-2-
hydrazino-1H-benzo[d]imidazole (51, $\mathrm{R}^{1}=\mathrm{F}, 720 \mathrm{mg}, 56 \%$ ) as white solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right) \delta 4.46(2 \mathrm{H}, \mathrm{br} \mathrm{s}), 6.63(1 \mathrm{H}$, broad), $6.87\left(1 \mathrm{H}, \mathrm{dd}, J=10.0\left(J_{\mathrm{HF}}\right)\right.$ and 1.6 Hz$), 7.05(1 \mathrm{H}, \mathrm{dd}, J=8.0$ and $\left.4.4\left(J_{\mathrm{HF}}\right) \mathrm{Hz}\right), 7.89(1 \mathrm{H}$, broad), $11.0(1 \mathrm{H}$, broad): 3318, 3272, $3025,2786,1672,1563,1480.1445,1409,1293,1243,1213,1148$, $1009 \mathrm{~cm}^{-1}$; ESI-HRMS (positive ion, sodium formate): calcd for $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{FN}_{4}\left([\mathrm{M}-\mathrm{H}]^{-}\right)$165.0581; found 165.0597; m.p.189-193.

Synthesis of 1-(5-fluoro-1H-benzimidazol-2-yl)-3-methyl-4-phenyl-1H-pyrazol-5-ol ( $\mathbf{7 l}$ ). A mixture of $\mathbf{5 l}(700 \mathrm{mg}, 4.21 \mathrm{mmol})$ and ethyl 3-oxo-2-phenylbutanoate ( $\mathbf{6 1}, 928 \mathrm{mg}, 4.21 \mathrm{mmol}$ ) in acetic $\operatorname{acid}(7 \mathrm{ml})$ was stirred for 12 h at ambient temperature. The reaction mixture was poured into water ( 30 ml ) and stirred at ambient temperatures. The resulting precipitates were collected by filtration, and washed water and then with $50 \% \mathrm{EtOH}$ to afford $(71,880 \mathrm{mg}$, $68 \%$ ). The other compounds studied in this work were prepared in a similar manner, and their analytical data are provided in Table I.

PCA-1-inhibitory activity. An assay system for PCA-1 demethylase inhibitors has been described in full elsewhere (6). Briefly, 4 ng of PCA-1 with or without investigatory compounds was incubated with 80 fmol 3-methyl cytosine oligo DNA (100 b.p.) (GeneDesign, Inc., Ibaraki, Osaka, Japan) as a substrate to be demethylated in buffer [50 mM Tris- $\mathrm{HCl}(\mathrm{pH} 8.0), 2 \mathrm{mM}$ ascorbic acid, $100 \mu \mathrm{M}$ oxoglutarate, and $40 \mu \mathrm{M}$ ferrous sulfate] and incubated at $37^{\circ} \mathrm{C}$ for 1 h . The reaction was stopped by dilution to 20 times volume by water. Two microliters of each sample produced was then used as template in real-time polymerase chain reaction (PCR) using BioRad iQ SYBR Green Supermix to $20 \mu 1$. The cycling conditions consisted of an initial single cycle at $95^{\circ} \mathrm{C}$ for 10 s followed by 40

[^1]Table II. Inhibition of prostate cancer antigen-1 (PCA-1) and DU145 cell growth, stability in S9 mixture after 10 min at $15^{\circ} \mathrm{C}$, and serum concentration at 60 min after oral administration of $32 \mathrm{mg} / \mathrm{kg} 2-(5-$ substituted benzimidazol-2-yl)-4,5-substituted-3-hydroxy-pyrazoles.

${ }^{\text {a }}$ See Figure 3. ${ }^{\text {b }} \mathrm{ND}$ : Not detected. $\Omega$
cycles at $95^{\circ} \mathrm{C}$ for 5 s , at $61^{\circ} \mathrm{C}$ for 30 s , and at $72^{\circ} \mathrm{C}$ for 15 s . The PCA-1-inhibitory effects of compounds were determined by quantitative analysis with real-time PCR.

Inhibitory effect of compounds on proliferation of DU145 cells. The experiments to examine the inhibitory effects of compounds with DU145 cells proliferation were carried out in a 96-well plate and the number of viable cells at the end of incubation was determined by 2-(4-iodophenyl)-3-(4-nitrophenyl)-5-(2,4-disulfophenyl)-2Htetrazolium, monosodium salt (WST) assay, which is determined by measuring the capacity of the cells to reduce WST to formazan. Briefly, $5 \times 10^{3}$ cells/well in $90 \mu$ culture medium were incubated in the presence or absence of each compound for 48 h . After addition of $10 \mu \mathrm{l}$ of WST-1/1-methoxy-5-methylphenazinium methylsulfate solution, the plates were incubated at $37^{\circ} \mathrm{C}$ in a humidified atmosphere containing $5 \% \mathrm{CO}_{2}$ for 2 h . Absorbance was then measured using a microplate reader with a test wavelength of 450 nm and a reference wavelength of 630 nm . The percentage of inhibition by each compound was calculated, compared with $0.1 \%$ DMSO-treated control.

Measurement of compound stability in S9 mixture. The tested compound ( $2 \mathrm{mg} / \mathrm{ml}$, reaction volume 1 ml ) was added to a S 9 mixture with co-factors (\#S9MIX; IEDA Co., Ltd., Tokyo, Japan) for 10 min at $15^{\circ} \mathrm{C}$ or $0^{\circ} \mathrm{C}$ as control (7). After washing with n-hexane, the target compounds were twice extracted with ethyl acetate. After removal of solvents by a speed-vac apparatus (KOIKE Precision Instruments Co., Ltd., Itami, Japan), the amount of compound was then determined using an HPLC system (\#8020; TOSOH Co., Ltd., Tokyo, Japan) with YMC-Pack Pro C18 (YMC Co., Ltd., Kyoto, Japan) at $1.0 \mathrm{ml} / \mathrm{min}$ of $0.1 \% \mathrm{TFA} / \mathrm{H}_{2} \mathrm{O}$ as mobile phase $\mathrm{A}, 0.1 \%$ $\mathrm{TFA} / \mathrm{CH}_{3} \mathrm{CN}$ as mobile phase B . The amount of the compound remaining in the S 9 mix was determined compared with the control.

Measurement of serum concentration of compounds in rats after oral administration. Male SD rats were fasted for 18 h then 10 or $32 \mathrm{mg} / \mathrm{kg}$ of compound was suspended in $0.5 \%$ methylcellulose (MC) and orally administered. At 30 or 60 min after administration,
blood samples were obtained from abdominal vein or subclavian vein under anesthesia and centrifuged, the serum was separated and stored at $-20^{\circ} \mathrm{C}$. The concentration of each compound in the serum was measured using HPLC as mentioned above.

Growth-inhibitory effect in mice bearing DU145 xenograft. Male nude mice were implanted subcutaneously with approximately $8 \times 10^{6}$ DU145 cells mixed with BD Matrigel ${ }^{\text {TM }}$ Basement Membrane Matrix High Concentration (BD Biosciences Bedford, MA, USA) into the right flank. When the estimated tumor volume had reached almost $200 \mathrm{~mm}^{3}$, after randomization into two treatment groups, HUHS015 or vehicle ( $50 \% \mathrm{DMSO}, 15 \% \mathrm{EtOH}$, $35 \%$ sterile water) was subcutaneously administered once a day for 28 days.

Next, male nude mice were implanted subcutaneously with approximately $8 \times 10^{6}$ DU145 cells mixed with BD Matrigel ${ }^{\mathrm{TM}}$ Basement Membrane Matrix High Concentration into the right flank. When the estimated tumor volume had reached almost 200 $\mathrm{mm}^{3}$, tumors were cut to $\sim 10 \mathrm{~mm}^{3}$ blocks and were then implanted subcutaneously into the right flank of another nude mouse of BALB/c background. When the estimated tumor volume in the mice had reached 100 to $300 \mathrm{~mm}^{3}$, animals were divided into three experimental groups of six mice and treated subcutaneously with docetaxel $(2.5 \mathrm{mg} / \mathrm{kg}$, once a week) or compound $71(10 \mathrm{mg} / \mathrm{kg}$, once a day) suspended in $0.5 \%$ MC for 25 days, all mice were equally administered $0.5 \%$ MC as vehicle. The tumor volume was calculated every 2 or 3 days using the following formula: tumor volume $\left(\mathrm{mm}^{3}\right)=L \times W^{2} / 2$, where $L$ and $W$ represent the length and the width of the tumor mass, respectively. The changes of tumor volume before administration were calculated. The day after last administration, blood samples were obtained from an abdominal vein under anesthesia and centrifuged, the serum was separated and stored at $-20^{\circ} \mathrm{C}$. Serum concentrations of glutamic oxaloacetic transaminase (GOT), glutamic pyruvate transaminase (GPT), creatinine, and blood urea nitrogen (BUN) were measured (WAKO Pure Chemical Industries, Ltd. Chuo-ku, Osaka, Japan). Results are shown as means $\pm$ SE of six mice and statistical significance of differences were analyzed by $t$-test.

Figure 4. The effects of compound $71[10 \mathrm{mg} / \mathrm{kg}$, subcutaneously (s.c.)] and docetacel (DTX, $2.5 \mathrm{mg} / \mathrm{kg}$, s.c., once a week) on body weights and tumor in mice bearing DU145 cell xenografts. After randomization into three groups, mice were administered DTX, 7l, or vehicle alone was administered s.c. once a week, or once a day, respectively. A: Tumor volume was calculated by caliper measurements of the width ( $W$ ) and length ( $L$ ) (volume $=L \times W^{2} / 2$ ), and tumor volumes were estimated relative to those at day 1.B:Body weights were measured at intervals. C: Tumor volumes $\left(\mathrm{mm}^{3}\right)$ were measured on the final day. Each value represents the mean $\pm$ SE of six mice. *Significantly different at p<0.05 in comparison with the vehicle-treated control by Student's $t$-test.

Table III. Inhibition of prostate cancer antigen-1 (PCA-1) and DU145 cell growth, stability in S9 mixture after 10 min at $15^{\circ} \mathrm{C}$, and serum concentration after oral administration of $10 \mathrm{mg} / \mathrm{kg} 2-(5-$ substituted- benzimidazol-2-yl)-4-substituted-3-hydroxy-5- methyl-pyrazoles.

Figure 5. Serum glutamic oxaloacetic transaminase (GOT), glutamic pyruvate transaminase (GPT), creatinine, andblood urea nitrogen (BUN) of mice were measured on the final day. The values represent means $\pm S E(n=6)$. No statistical significance was observed by Student's $t$-test.

## Results and Discussion

We evaluated the stability of compounds studied in this work and estimated their anti-PCA-1/ALKBH3 and anti-DU145 cell growth activities in vitro (Table II).

Replacement of the methyl at the 5-position of the benzimidazole ring (R1) with Cl (7a) produced almost 2-fold increase in stability in the S9 mixture treatment (1: $42 \%$ vs. 7a: $81 \%$ remaining, Table II), and a higher serum concentration $(0.15 \mu \mathrm{~g} / \mathrm{ml})$ compared to those of $\mathbf{1}(0.08 \mu \mathrm{~g} / \mathrm{ml})$, while anti-PCA-1/ALKBH3 activity was reduced [half maximal inhibitory concentration $\left(\mathrm{IC}_{50}\right)=0.7$ vs. $\left.4.5 \mu \mathrm{M}\right]$, indicating that the methyl was metabolized in the liver and that modifications which yielded derivatives with resistance to metabolic reactions in the S 9 mixture would be effective for enhancement of in vivo activities.

Replacement of the methyl with trifluoromethyl (7b) and 4-Me-phenyl (7c) also afforded stable derivatives in the S9 mixture treatment (Table II), while anti-PCA-1/ALKBH3 and anti-DU145 growth activities were reduced. Compound 7c was, curiously, not detected in serum, while it was relatively stable in the S 9 mixture. We speculate that this result was due to the low solubility of $\mathbf{7 c}$ (data not shown) and that $7 \mathbf{c}$ might be precipitated in gastrointestinal tract after oral administration.

Replacement of the benzyl with a carboxylate (7e) resulted in good serum concentration $(0.22 \mu \mathrm{~g} / \mathrm{ml}, 60 \mathrm{~min}$ after oral
administration), but showed only weak inhibitory activities on PCA-1/ALKBH3 and growth of DU145 cells. Derivatives bearing phenyl rings ( $\mathbf{7 d}, \mathbf{7 g}-\mathbf{7 h}$ ) or a diphenylmethyl (7f) instead of a benzyl at the 4 position of the pyrazole were then synthesized because such benzyl moieties are often metabolized (Figure 1). Compounds $7 \mathbf{d}$ and $\mathbf{7 g}$ demonstrated good stability in the S 9 mixture and good serum concentrations after oral administration $(2.45 \mu \mathrm{~g} / \mathrm{ml}$ and $1.03 \mu \mathrm{~g} / \mathrm{ml}$, respectively), which were more than 10 times higher than those of $\mathbf{1}$ (Table II). Based on these results, we fixed the phenyl at the 4 position of the pyrazole for further studies because such stability in the S 9 mixture and good bioavailability properties were attractive.
Replacement of the methyl group of the benzimidazole in 7d, which could be as easily metabolized by the liver as the methyl group of $\mathbf{1}$, with putatively metabolically stable groups, trifluoromethyl ( $7 \mathbf{j}$ ), methoxy ( $\mathbf{7 k}$ ), and fluoro atom ( $\mathbf{7 1}$ ), was carried out. Derivatives 7d, 7j, and $\mathbf{7 l}$ exhibited serum concentrations of 1.00 .0 .63 , and $1.02 \mu \mathrm{~g} / \mathrm{ml}$ at 30 min after oral administration at $10 \mathrm{mg} / \mathrm{kg}$, respectively, in line with our expectations (Table III). Moreover, compounds $\mathbf{7 k}$ and $\mathbf{7 1}$ exhibited more potent anti-growth activities compared to that of $\mathbf{1}$, while their anti-enzymatic inhibitory activities were weaker than that of $\mathbf{1}$. We thought this discordance between the enzyme assay and cell-based assay was due to differences in their membrane-permeability. Introductions of substitutions
on the phenyl ring ( $\mathbf{7 m} \mathbf{- 7} \mathbf{p}$ ) produced disappointing inhibition of anti-PCA-1/ALKBH3 (Table III). Among this series, we selected compound $\mathbf{7 1}$ for further studies because it exhibited the highest serum concentration both at 30 min and 60 min after oral administration ( $10 \mathrm{mg} / \mathrm{kg}$ ) and adequate inhibitory activities both in enzymatic $\left(\mathrm{IC}_{50}=2.9 \mu \mathrm{M}\right)$ and DU145 assays ( $63 \%$ inhibition at $1 \mu \mathrm{M}$ ). The serum concentration of 71 was almost 10 times higher than that of HUHSO15 (1) at 60 min after oral administration ( $10 \mathrm{mg} / \mathrm{kg}$ ), and its anti-growth effects on DU145 were slightly more potent than those of 1 , while its PCA-1/ALKBH3 inhibitory activity was weaker than that of $\mathbf{1}$.

The growth inhibition by compound 71 in the xenograft model bearing DU145 tumors was examined for 26 days ( 10 $\mathrm{mg} / \mathrm{kg}$, s.c.) and compared to the inhibition exerted by docetaxel at approximately its clinical dosage ( 8$)(2.5 \mathrm{mg} / \mathrm{kg}$, s.c., Figure 4). Compound $\mathbf{7 1}$ demonstrated potent growthinhibitory activity compared to docetaxel without limiting weight gain, even after 26 days of continuous administration. The inhibitory activity of compound $\mathbf{7 1}$ was more potent than that of $\mathbf{1}$. Docetaxel administration at $2.5 \mathrm{mg} / \mathrm{kg}$ was a critical dose in the DU145-bearing xenograft model because continuous administration at this dose caused edema-like side-effects (9) that are often observed in clinical use. Serum concentrations of GOT, GPT, creatinine, and BUN were measured on the final day (Figure 5), and there were no obviously irregular values, indicating a low toxicity of compound 71.

## Conclusion

We designed and synthesized metabolically stable HUHS015 derivatives and evaluated their stabilities in S9 mixture and their serum concentrations after oral administration because HUHS015 is easily metabolized and decomposed in vivo. We also estimated the anti-PCA-1 and anti-growth activities of these derivatives in vitro to obtain potent novel PCA1/ALKBH3 inhibitors in vivo. As a result of modifications to $\mathbf{1}$, replacements to two metabolically susceptive moieties, the methyl group at the 5 position of benzimidazole and the benzyl of $\mathbf{1}$, to the more stable fluoro atom and phenyl group in compound 71 were effective both in improving the stabilization in S 9 mixture and in achieving a high serum concentration after oral administration. Compound 71 exhibited potent inhibitory activities against DU145 tumors in a xenograft model without observable side-effects after subcutaneous administration for 26 days, as expected. Currently, further modifications of compound $7 \mathbf{7 l}$ and other derivatives to obtain a clinical trial compound are in progress. Additionally, the effects of combination treatment with PCA-1/ALKBH3 inhibitors and prostate cancer drugs mainly used in clinic, such as docetaxel, are also in progress and will be reported in the near future.
